

SPEAKERS OBELISK

an interactive Speakers Corner for Cairo (concept/prototype)

An interactive 4-channel sound sculpture allows visitors to play their announcements, messages and music directly through it.

This can happen 2 ways:.

-- via bluetooth technology and their smart phones visitors can also play their songs „live“ through one of the channels.

-- via a direct „line in“ socket local musicians and performers can give concert events that happen in and around the sculpture.

The sculpture is split into 4 channels on different sides so that messages do not interfere with one another.

The sound volume is regulatable via a mixing board.

As „heartbeat“ sound the sculpture also plays low-level „white noise“ sound from 4 radio receivers.

Equipment: 500 recycled loudspeakers, 4 amplifiers, 4 Bluetooth receivers, 4 radio receivers.
